

Why a **HEATWAVE** Firegrate?

Solid base - wont burn out! Heatwave Firegrates have a been designed with a solid base and this has proved a winner. With a solid base, the constant heat and flames have no contact with an open edge to start the process of burning the grate out!

Hotter fire! The hottest part of any fire is where the air flow meets the flames and wood. With this design the air comes in from the front of the grate meaning the hottest part of the fire is right where you want it! This radiates more heat out into your room (See diagram below).

Stylish! The Heatwave firegrates have been praised by 100's of customers for their subtle beauty. The design is sure to compliment your fireplace and add character and ambiance to your room.

Easy to clean! Yes, easy to clean! Just draw the grate forward and up-end, tipping the ash into the fire pit, or a suitable container. Please be aware, the ash can retain heat for many days and become a fire hazard. It must be disposed of responsibly!
